

VU3INI Android TV Cleaner

Clean the ads, tracking and clutter off your Android TV:
step by step, fully offline, nothing uninstalled

User guide - version 2.0 - November 2026

Sasanka Boruah, VU3INI - hamvu3ini@gmail.com

For Windows 10 and Windows 11 (64-bit) PCs and Android TV / Google TV sets. Built on the open-source CleanYourTV project (github.com/Gathin23/cleanyourtv).

1. What it does

Most smart TVs arrive with apps you never asked for: telemetry and diagnostics services that report what you do, advertising and recommendation rows on the home screen, auto-installers, and preloaded extras. On a TV with 1 to 2 GB of memory they also make everything slower. **VU3INI Android TV Cleaner** switches these off for you, over your home network, in a guided wizard.

- **Uses tested lists.** CleanYourTV's volunteers have tested what is safe to switch off on 456 TV models from 122 brands (OnePlus, Sony, TCL, Xiaomi, Philips, Hisense and many more). The app reads your TV and suggests the right list.
- **You decide what stays.** Every app in the list is shown with what it is and whether your TV has it. One click keeps casting, USB media, the Bluetooth speaker mode, the voice assistant or your streaming apps.
- **Nothing is uninstalled.** Apps are only disabled. Before the first change the app saves a record of the TV, so **Undo** puts everything back exactly as it was.
- **A cleaner, faster home screen** (optional): CleanYourTV's small launcher replaces the stock home screen and its ad rows, with your choice of look, dock apps and Live TV app.
- **Keeps working after updates.** A TV firmware update can switch apps back on; one button checks and re-applies your choices.
- **Completely offline.** Python, the Java JDK 17, the Android SDK, Gradle and CleanYourTV are all inside the installer. No account, no internet, no cable, and no rooting.
- **Nobody edits a file.** Every choice is made on screen; the app writes the lists and settings itself.

What you need

- A Windows 10 or 11 PC (64-bit) on the same home network as the TV, with about 2.5 GB free for the installed app.
- An Android TV or Google TV (for example a OnePlus TV) and its remote.
- Only once, to make the installer: a PC with internet and about 8 GB free (see section 2). The installer it produces can then be copied to any PC and used with no internet.

2. Making the offline installer (once)

The zip file contains **Build-Installer.bat**, a single file that downloads every component once and packs them into one installer. Do this on any Windows 10/11 PC with internet:

1. Unzip **VU3INI-AndroidTVCleaner-Builder-2.0.zip** into a folder, for example your Downloads folder.
2. Double-click **Build-Installer.bat**. A black window opens and shows each stage as it runs: Python, the Java JDK, the Android SDK, the CleanYourTV project, the Python packages, a full test build of the home screen with the internet switched off (to prove nothing is missing), the app itself, and finally the installer.
3. Wait 20 to 40 minutes the first time. Downloads are kept in **C:\VU3INI-build**, so a later run takes only 10 to 25 minutes.

4. When it says **Done**, the installer is in the **output** folder next to the .bat file: **VU3INI-Android-TV-Cleaner-Setup-2.0.exe** (about 500 to 700 MB).

Tips: if drive C: is short of space, run **Build-Installer.bat -WorkDir D:\VU3INI-build**. To start completely afresh, run **Build-Installer.bat -Rebuild**. If the window stops with a red FAILED line, copy its text; it says which stage failed and why.

3. Installing the app (no internet needed)

1. Copy **VU3INI-Android-TV-Cleaner-Setup-2.0.exe** to the PC that will clean the TV (a pen drive works).
2. Double-click it. If Windows SmartScreen says it protected your PC, choose **More info** and then **Run anyway** (the app is not signed by a commercial certificate).
3. Keep the suggested folder **C:\VU3INI\ATVCleaner**. Gradle and the Android SDK need a folder without spaces, so the installer refuses one with spaces. No administrator rights are needed.
4. Optionally tick **Create a desktop shortcut**, then press **Install**. It takes a few minutes.
5. Leave **Launch VU3INI Android TV Cleaner** ticked and press **Finish**. The wizard opens at Step 1.

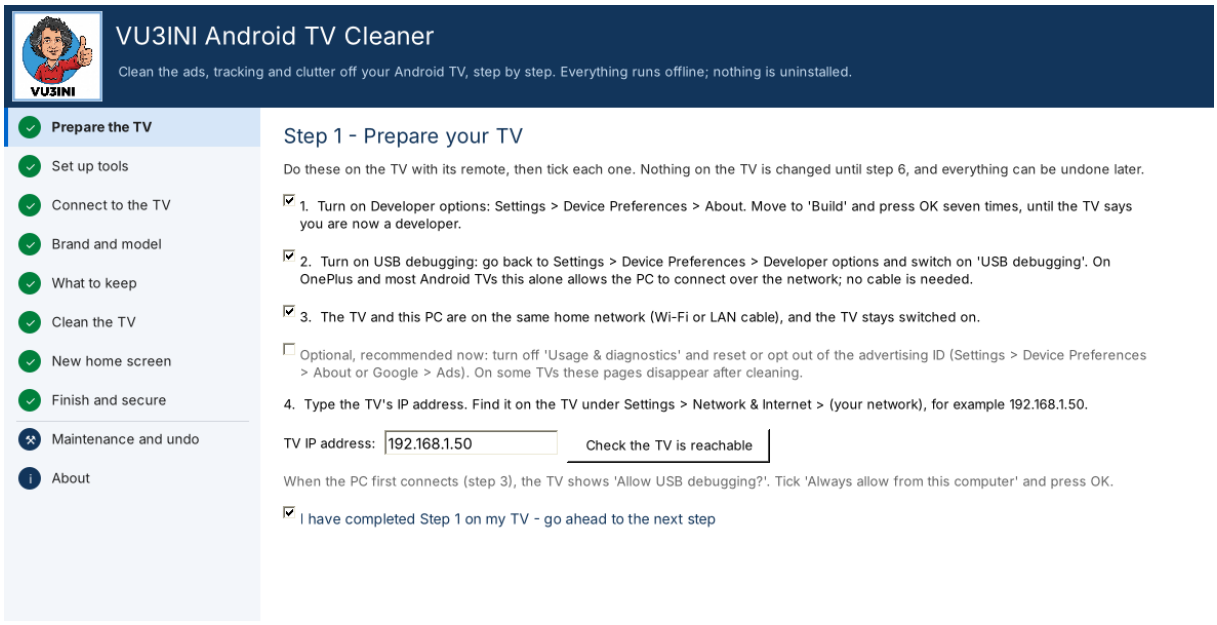

To remove it later: Windows Settings > Apps > Installed apps > VU3INI Android TV Cleaner > Uninstall. Uninstalling the app does not change the TV; use Undo first if you want the TV back as it was.

4. Using the wizard

The left side lists the eight steps. A green tick marks each finished step, and **Next** only unlocks once the current step is complete. The activity log at the bottom shows exactly what the app is doing.

Step 1 - Prepare the TV

On the TV: **Settings > Device Preferences > About**, then press OK on **Build** seven times until it says you are a developer. Then go to **Device Preferences > Developer options** and switch on **USB debugging**. On OnePlus and most Android TVs this lets the PC connect over the network, with no cable. Tick each item in the app, type the TV's IP address (shown under **Settings > Network & Internet**), and tick **I have completed Step 1**.

Step 1: the TV preparation checklist. Next unlocks only after you confirm.

Step 2 - Set up tools

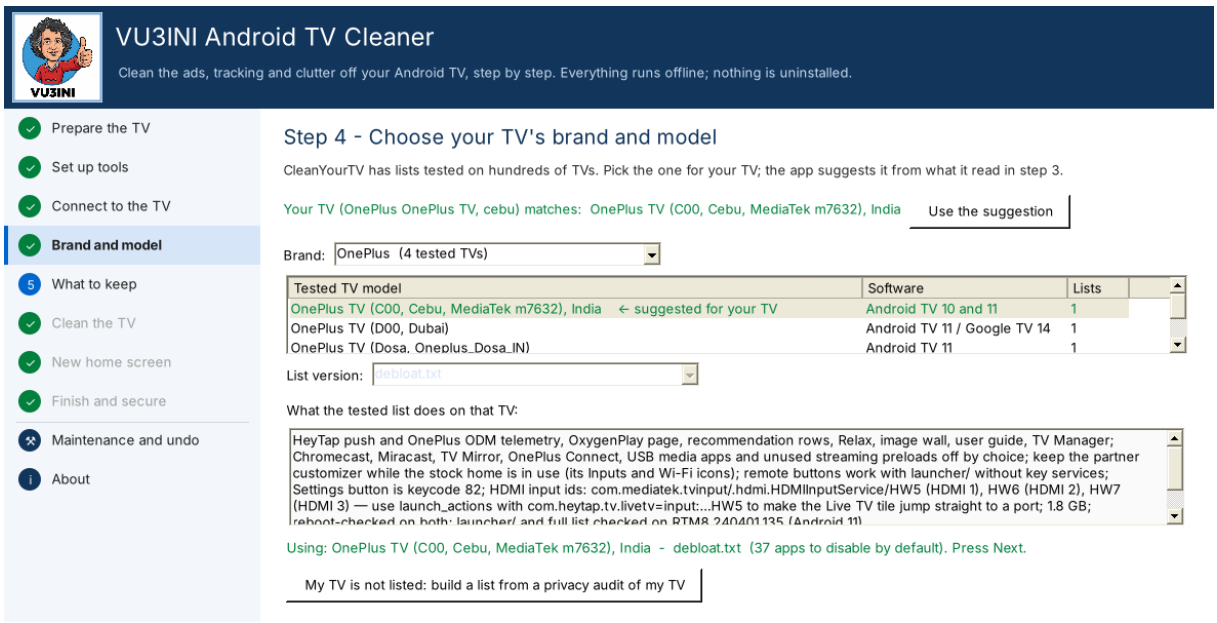

Runs by itself. It checks every bundled part and finishes the setup in a minute or two, with no internet.

Step 3 - Connect to the TV

Press **Connect to the TV**. The TV asks **Allow USB debugging?**: tick **Always allow from this computer** and press OK. The app reads the model, codename, Android version and installed apps. Nothing is changed.

Step 4 - Brand and model

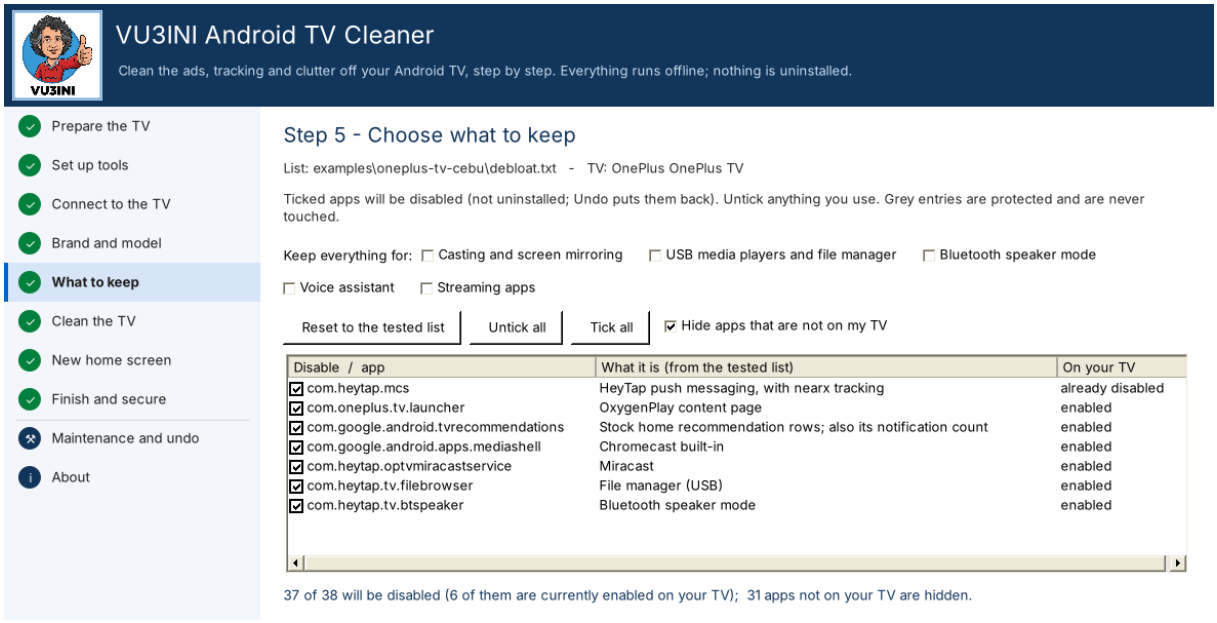

The app suggests the tested list that matches your TV, for example *OnePlus TV (C00, Cebu)*. Press **Use the suggestion**, or choose another brand and model yourself. The notes box shows what the testers found on that TV. If your TV is not listed, the app can build a list from a privacy audit of the TV instead.

Step 4: the matching tested list is suggested and highlighted in green.

Step 5 - What to keep

Ticked apps will be disabled. Untick anything you use, or use the **Keep everything for** switches: casting and screen mirroring, USB media players, Bluetooth speaker mode, voice assistant, streaming apps. Grey entries are protected parts of Android and are never touched. **Save choices** stores them for next time.

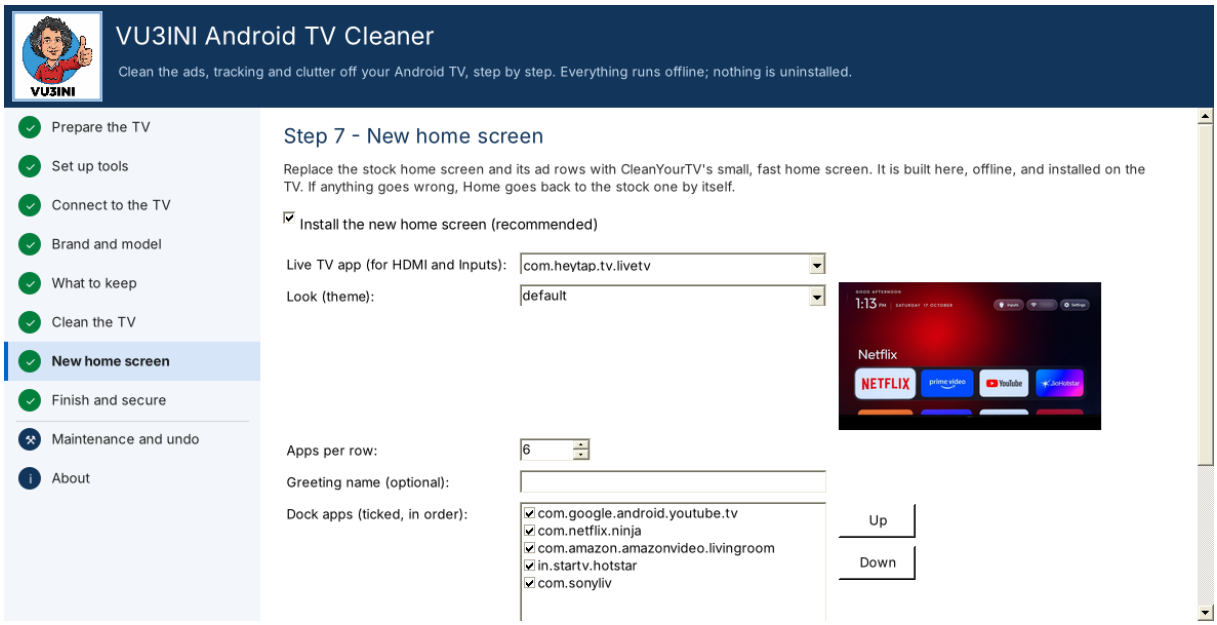

Step 5: choose what stays. The right-hand column shows whether each app is on your TV.

Step 6 - Clean the TV

Press **Clean my TV now** and confirm. The app first records how the TV is now (for Undo), then disables the apps you ticked. The stock home screen is deliberately left alone until Step 7.

Step 7 - New home screen (optional)

Choose the Live TV app (pre-filled for your TV), a look with preview, apps per row, an optional greeting, and the dock apps in the order you like. Press **Install the home screen and finish cleaning**. The app builds it on the PC, installs it, applies your look, finishes the cleaning and offers to restart the TV. If anything goes wrong, Home returns to the stock screen by itself. Press **Skip** to keep the stock home screen.

Step 7: look, dock apps and Live TV app for the new home screen.

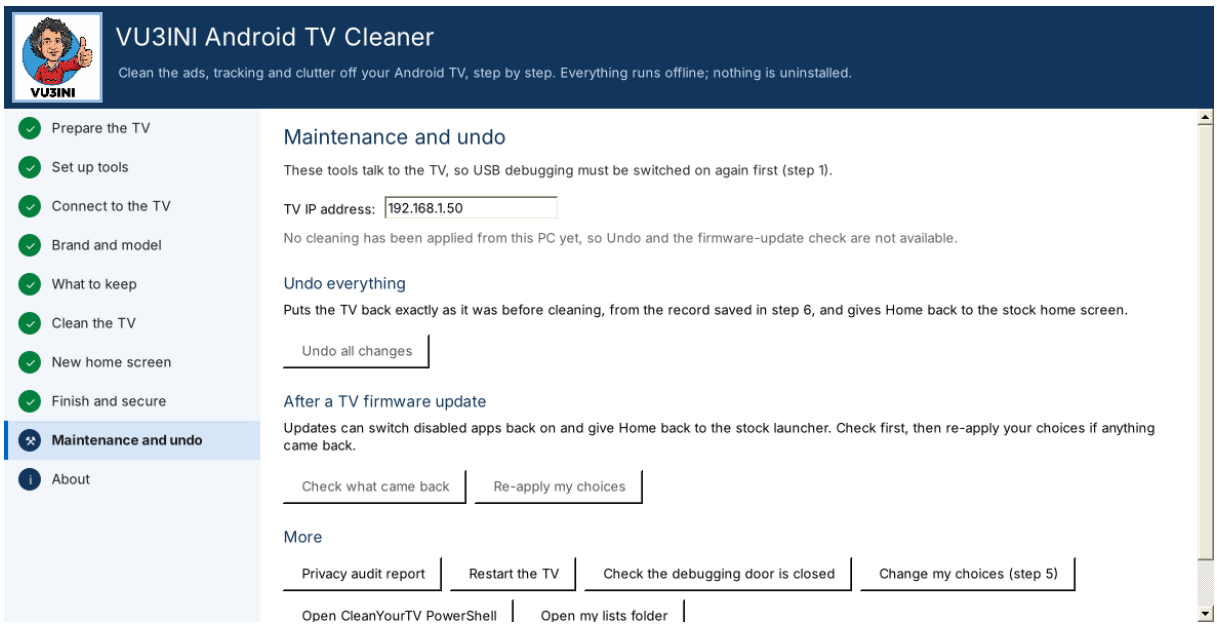

Step 8 - Finish and secure

Network debugging has no password, so switch it off when you are done: **Developer options > USB debugging: off**, then **Revoke USB debugging authorisations**, and restart the TV. Press **Check that the debugging door is closed**; it turns green when the TV no longer accepts connections. The new home screen keeps working.

5. Maintenance and undo

Open **Maintenance and undo** from the left side at any time. First switch USB debugging on again (Step 1).

- **Undo all changes**: puts the TV back exactly as it was before cleaning and gives Home back to the stock screen.
- **Check what came back** and **Re-apply my choices**: use these after a TV firmware update.
- **Privacy audit report**: shows which apps on the TV handle voice, content recognition (ACR) and telemetry, with the evidence.
- **Restart the TV**, **Change my choices** (back to Step 5), **Open CleanYourTV PowerShell** for advanced users, and **Open my lists folder**.

Maintenance and undo.

6. If something does not work

What you see	What to do
Step 3: Could not connect	TV switched on and awake? Same network? USB debugging on? IP correct? Press Connect again and accept **Allow USB debugging?** on the TV within a few seconds.
Step 2: a part shows Missing	Run the installer again (it repairs the folder). The app never downloads anything itself.
HDMI shows No Signal after cleaning	Use Maintenance > Undo, or untick the package the testers' notes mention in Step 5 and clean again. The OnePlus lists already keep the HDMI services.
Apps came back after a TV update	Maintenance > Check what came back, then Re-apply my choices.
Setup.exe refuses the install folder	Choose a folder without spaces, for example C:\VU3INI\ATVCleaner.
Building the installer stopped (FAILED)	Copy the red lines and the few lines above them; they name the stage and the reason. Run Build-Installer.bat again after fixing it; finished stages are reused.

Where things are kept: the app in C:\VU3INI\ATVCleaner; your settings and lists in %APPDATA%\VU3INI\AndroidTVCleaner; CleanYourTV's undo records in %USERPROFILE%\.cleanyourtv.

7. Credits and licences

VU3INI Android TV Cleaner is by Sasanka Boruah, VU3INI (hamvu3ini@gmail.com). It is a front end for **CleanYourTV** by Gathin23 and contributors (MIT licence), whose tested lists, scripts and launcher do the real work. Bundled components keep their own licences: Python (PSF licence), Eclipse Temurin JDK (GPLv2 with the Classpath Exception), Android SDK components (Android Software Development Kit Licence, accepted when the installer is built), and Gradle and its dependencies (Apache 2.0). See THIRD-PARTY-NOTICES.txt in the install folder.

Use at your own risk: disabling system apps is reversible with Undo, but always review Step 5 for apps you rely on.
